

**NAME**

curl\_global\_cleanup - Global libcurl cleanup

**SYNOPSIS**

```
#include <curl/curl.h>
```

```
void curl_global_cleanup(void);
```

**DESCRIPTION**

curl\_global\_cleanup must be called once (no matter how many threads or libcurl sessions that'll be used) by every application that uses libcurl, after all uses of libcurl is complete.

This is the opposite of *curl\_global\_init*.

Not calling this function may result in memory leaks.

This function was added in libcurl 7.8.
