

Using Lua \LaTeX to typeset RTL text with eledpar

Abstract

This file provides an example on how to use eledpar and Lua \LaTeX to typeset a right to left text with its translation on the facing page¹.

As you can see, the switch to RTL convention is made *before* the **pstart**. It must be also called inside **\eledsection**.

For an example with X \LaTeX , look at parallel-column-two-languages.tex file.
